

Document Translation Example

A text-layer PDF used to verify page-aware bilingual reading and export.

Readable PDF text

FluentRead extracts text from each PDF page locally, groups it into readable segments, and keeps a page label beside the first segment.

The bilingual download keeps the original page and follows it with a generated translation page, so the source remains available for comparison.

Regression coverage

The second page proves that page boundaries survive parsing and remain visible in the reading interface.

A scanned PDF without a text layer is rejected with a clear OCR-specific message instead of producing empty or corrupted output.
